
Retrofit Planner

Retrofit cost, saving and payback for one specific house, from four simple questions about it.

Lloyds Launch 2026 | Homes | RetrofitPlanner.co.uk

Built and run by one person. Plans to register in Q4 2026.

The incentive is funded. The decision is not.

- **£250 billion of home retrofit needed by 2050**

Cited by Lloyds. By value, 39% of its residential mortgages with a known EPC are band D, 17% E to G.

- **Over 3,000 green home reward claims in 2025**

Against over £320bn of mortgages. Up to £2,000 is available and almost nobody takes it.

- **EPCs do not measure what a house actually uses**

Lloyds 2025 sustainability report: EPCs capture neither actual energy use nor recent retrofit work, and a 2.0% gap to the financed emissions pathway is attributed to EPC data limits.

A household will not act on a cost and a saving. They act on how many years the money takes to come back, and which measure to do first. The bank tools' own descriptions never mention it.

Built from government microdata, published openly

DESNZ National Energy Efficiency Data-Framework 2026. 39,502 gas heated records with 2024 consumption, England and Wales. Median gas per property type and floor area band, calibrated to reproduce NEED published medians within 0.3% for 2 to 5 bedrooms and 3.3% for 1 bedroom.

Four inputs. No smart meter, no survey, no account, no address.

property type | bedrooms | insulation level | heating fuel

39,502

gas heated NEED records behind the table

18 + 154

guides and table cells checked against the model
automatically

Method at </methodology/>. The model table itself is readable at </js/heat-model.js>.

Everything about it is checkable

- **The method is published, and enforced**

Comparable tools return a score or an estimate without saying how it was produced. This one publishes the model table and the method behind it, and automated checks compare the heat demand and cost figures in 18 guides and 154 table cells against that table before anything goes live.

- **No AI, by choice, not anti AI**

A heat pump often costs five figures and a household lives with it for 15 years, so the method and the data behind the number should be visible, not just a confident answer. Deterministic arithmetic over public data that anyone can check or work through by hand.

- **It withholds the sale**

The boiler tool hides both the quote prompt and the quote form when a new boiler is cheaper over 15 years even on a heat pump tariff: at a £900 gas bill, 35 of its 120 input combinations. At a typical £860 bill the solar tool tells all 420 battery combinations to price the battery separately, and shows a 25 year loss in 213.

Small, growing fast, not yet tested house by house

Monthly impressions on Google search

3.6

average Google position for the 4 bed heat pump cost guide

Every month

clicks from Google have grown every month since launch. September passed all of August with eight days to spare.

What I do not have, stated plainly

The calculators store nothing and ask for no personal details, so there is no count of calculator uses, no completion rate and no user feedback. The model has been tested against measured data in aggregate, but no output has yet been checked against one house's quote or its metered consumption. Establishing that accuracy is the first thing a pilot should do.

12 weeks, one cohort, a falsifiable result

● Who

Mortgage customers at EPC band D or E, where the model is calibrated, against a matched holdout. At a 0.1% yearly claim rate, a 6 month read needs roughly 47,000 per arm.

● What they see

A payback figure and a ranked list of measures for their own home, inside a page Lloyds already runs.

● Measured by

Green additional borrowing drawn, and model accuracy against the customer's own annual kWh. No difference at 6 months means it did not work.

Commercially

Not seeking investment. A pilot first, to find out whether it works. If it does, we agree terms for wider use. No revenue share and no referral links on a Lloyds page. It is a lookup table plus arithmetic, so no customer data needs to move.
